

Personal Recorder

Create reach video content from any computer and from anywhere

Enable creation of quality video content automatically from anywhere in the world and immediately sharing it via the web

- ✓ Record and synchronize video, audio and content from the computer screen, as well as files and accompanying links and creates a rich data unit from them.
- ✓ The data unit includes, inter alia: video and audio of the person speaking, recording of the speaker's screen, visual index as well as navigation capabilities and tools enabling interactive discussion, based on the recorded content.
- ✓ Streamitup In-Video-Search technology analyze the displayed content and make the recorded unit searchable.

Expansion of the Boundaries

Managers, partners and employees are situated in various locations within the organization and outside of it: customers' sites, exhibitions, company branches and more. In many cases it is very worthwhile to visually share the data and activities rapidly and easily.

The Streamitup Personal application enables the employee to connect via his PC to the cloud from anywhere and to automatically share reach video content with his colleagues.

Simple Operation

The application synchronizes the various data sources such as video, audio, presentations, files and links, and then feeds the data unit created to the appropriate common channel on the cloud.

Converting the video content itself to be searchable transforms the Organizational knowledgebase and facilitates rapidly and easily reaching every scrap of information within it.

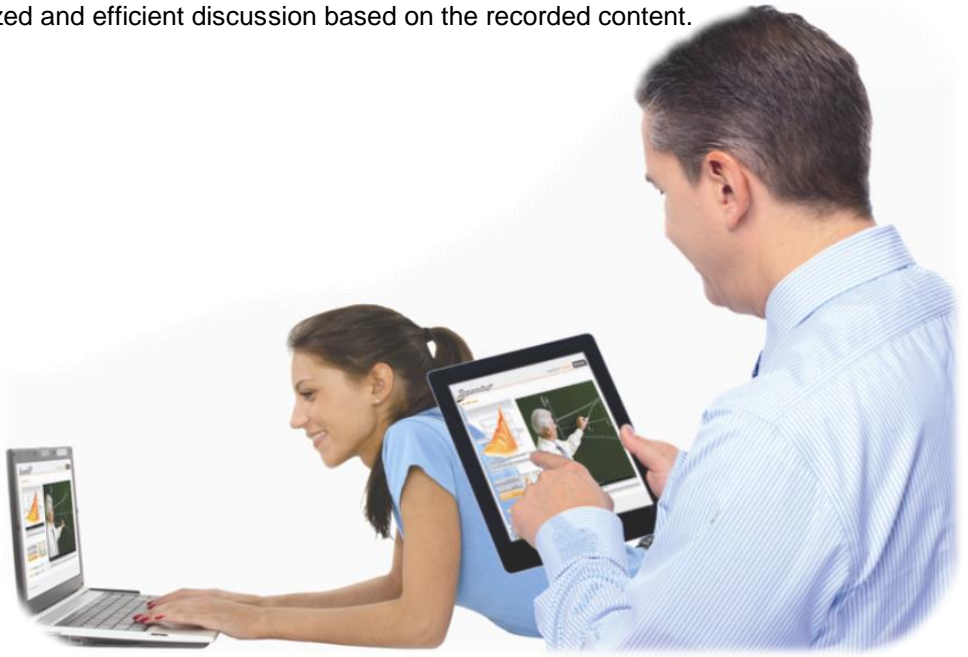

Content Sharing

Video, audio, presentations, applications, movies and documents become searchable. They are presented in parallel, synchronized and in high quality. The recorded content will be added to the relevant content channel and will be accessible to the relevant viewers

Virtual Forum

Any of the viewers can add his comments – each comment is synchronized to the appropriate point in time of the video content and become searchable. The person making the comment can choose to share it with other participants of the channel or to leave it as private.

This capability facilitates a synchronized and efficient discussion based on the recorded content.

- Viewers connect to their personal accounts from their computers, tablets or smart phones.
- By using Streamitup In-Video-Search technology, video content is searchable and can be accessed directly from anywhere in the organization portal or by direct access to the relevant knowledge channel
- The viewing interface includes a visual summary of the data. This summary is automatically generated by the application and facilitates immediate access to points of interest and provides a quick glimpse at the entire data unit.
- The viewer can download to a local device external files that were uploaded by the content creator.
- The viewer can add his personal comments based on the recorded content – every comment is synchronized to the appropriate point in time of the video and is saved by the system in the viewer's personal account.
- The viewer can share each of his comments with the other participants of the channel, this capability facilitates managing separate discussion channels between different discussion groups.
- The management system connects to the customer's content management systems and facilitates rapid and hierarchical definition of all the content channels and access permissions.

Useful solution for:

- ✓ Recording training sessions or other activities by an expert,
- ✓ Sharing visual impressions from exhibitions or conferences, while adding explanations and an online discussion with team members
